Appl. on recurrent failures of water networks

Conclusion 00

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~

Main Aim of analysis of recurrent events

- statistical analysis (and modeling) of non-independant occurrence times of an event.
 - more than one event per individual.
 - interest in understanding the dependancy between times
- heterogenity and risk factors (covariates observed on individuals)
 - identify the covariates that influence the probability of event.
 - individual prediction of probability of occurrence knowing the characteristics of the individual
- Heterogeneity and frailties
 - does the intensity of events differ from individual to individual because of covariates or past history ?
 - dynamic intensity modeling versus frailty intensity modeling.

Appl. on recurrent failures of water networks 0000000 Conclusion 00

Appl. on recurrent failures of water networks

Conclusion 00

The counting process for recurrent events

Definition of the (stochastic) intensity

with respect to a history $\mathcal{H}(t)_{t>0}$ (filtration generated by the known history) :

$$\lambda(t) = \lim_{dt\to 0} \frac{1}{dt} \mathbb{P} \left[N(t+dt) - N(t) = 1 \mid \mathcal{H}(t-) \right]$$

$$\lambda(t)dt = \mathbb{E} \left[dN(t) \mid \mathcal{H}(t-) \right],$$

200

The marginal intensity : the rate function

•
$$\mathcal{H}(t)$$
 contains jump times and "external covariates" $Z(t)$,
 $\mathcal{H}(t) = \sigma \left(N(t), T_1, ..., T_{N(t)}, Z(t) \right)$

Note : $\lambda(t)$ is a predictable process, it captures the nature of the recurrence of events.

The rate function (ROCOF in reliability analysis)

$$\begin{aligned} r(t) &= \lim_{dt \to 0} \frac{1}{dt} \mathbb{P} \left[N(t+dt) - N(t) = 1 \mid Z(t-) \right] \\ r(t)dt &= \mathbb{E} \left[dN(t) \mid \mathcal{Z}(t-) \right], \end{aligned}$$

Ex : (Chiang, 1968)

$$\begin{aligned} \lambda(t) &= \beta_0(t) + \beta_1(t)Z + \beta_2(t)N(t-) \\ r(t) &= \beta_0(t) + \phi(\beta_1,\beta_2)Z + \psi(\beta_0,\beta_2)\beta_2(t), \end{aligned}$$

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト ○ 臣 - のへで

Appl. on recurrent failures of water networks 0000000 Conclusion 00

Recall the Cox model for survival analysis

• One event per subject \rightarrow Survival analysis : $\lambda(t) = h(t)I_{N(t)=0}$

$$h(t) = \lim_{dt\to 0} \frac{1}{dt} P\left(T \in [t, t + dt] | T > t\right)$$

 $\bullet~$ regression model for covariate \rightarrow Multiplicative intensity model

$$\lambda(t) = \lambda_0(t)e^{\beta_0 + \beta_1 Z_1 + \dots + \beta_p Z_p} \mathbf{1}_{N(t-)=0}$$

Remark :

- A dead individual is no more "at risk"
- censoring mechanism may be considered **too** \rightarrow "At risk" process Y(t).

Appl. on recurrent failures of water networks 0000000

from Cox regression for lifetimes to Andersen and Gill intensity of counting processes

Remove The "at risk" indicator Y(t) to remains "at risk" after the event.

Andersen & Gill, 82

$$\lambda(t)dt = \mathbb{E}\left[dN(t) \,|\, Z_1, \dots Z_p\right] = \lambda_0(t)e^{\beta_0 + \beta_1 Z_1 + \dots + \beta_p Z_p} \,dt$$

- The points of N(t)t≥0 form a Poisson process conditionally on the values Z₁,...Z_p.
- the process intensity does no depend on the past \rightarrow not *dynamic*.

The LEYP process

Appl. on recurrent failures of water networks

Conclusion 00

Models for the intensity process in reliability analysis

Some well known models for the intensity process

- dynamic intensity : impact of occurrence of an event on the intensity *N*(*t*-) *or event times themselves* ?
- observed "inter-unit" heterogenity : impact of covariates multiplicative intensity with "Cox-like" contribution.
- unobserved "inter-unit" heterogeneity : frailty : ?? it may be hard to handle both frailty and dynamic parts.
- **Rk** : in reliability (in this talk) :
 - an event = failure + instantaneous maintenance/repair
 - the dynamic part explains the maintenance actions.

The Poisson process with covariates

Cox regression model for recurrent events :

 $\lambda(t) = \lambda_0(t)e^{\beta' Z}$, The Z's may be time-dependent

- λ_0 usually increasing, (\Rightarrow ageing).
- $e^{Z'\beta}$: impact of environment and/or individual heterogeneity

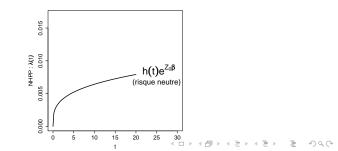

The Poisson process with covariates

Cox regression model for recurrent events :

 $\lambda(t) = \lambda_0(t)e^{\beta' Z}$, The Z's may be time-dependent

• λ_0 usually increasing, (\Rightarrow ageing).

• $e^{Z'\beta}$: impact of environment and/or individual heterogeneity

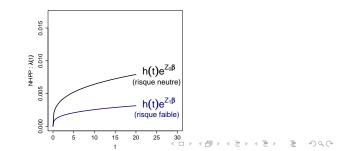

The Poisson process with covariates

Cox regression model for recurrent events :

 $\lambda(t) = \lambda_0(t)e^{\beta' Z}$, The Z's may be time-dependent

• λ_0 usually increasing, (\Rightarrow ageing).

• $e^{Z'\beta}$: impact of environment and/or individual heterogeneity

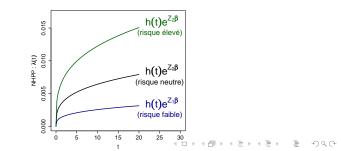

The Poisson process with covariates

Cox regression model for recurrent events :

 $\lambda(t) = \lambda_0(t)e^{\beta' Z}$, The Z's may be time-dependent

• λ_0 usually increasing, (\Rightarrow ageing).

• $e^{Z'\beta}$: impact of environment and/or individual heterogeneity

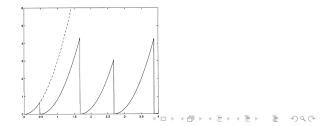

Appl. on recurrent failures of water networks 0000000 Conclusion 00

A renewal process for recurrent events

RP process (perfect repairs, AGAN models) :

$$\lambda(t) = \lambda_0 (t - T_{N(t)}) e^{\beta' Z},$$

- λ_0 usually increasing, $\lambda_0(0) = 0 \iff ageing)$.
- the intensity uses the *duration* since the last event $t T_{N(t)}$.
- inter-arrival durations are i.i.d. random variables
- *dynamic* intensity.

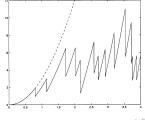

A generalized renewal process for recurrent events

GRP process (imperfect repair, virtual age models) :

$$\lambda(t) = (\lambda_0(t) - \rho \lambda_0 (T_{N(t-)})) e^{\beta' Z} \text{ ARI1}$$
$$\lambda(t) = (\lambda_0 (t - \rho T_{N(t-)})) e^{\beta' Z} \text{ ARA1}$$

- λ_0 usually increasing, $\lambda_0(0) = 0 \iff ageing)$.
- ρ captures the *dynamic* of the reduction of intensity

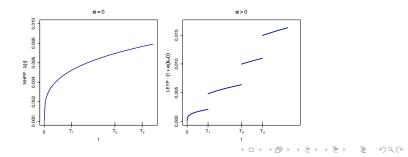

The linear extended Yule process for recurrent events

LEYP process (imperfect repair) :

$$\lambda(t) = (1 + \alpha N(t-))\lambda_0(t)e^{Z(t)'\beta}$$

- a dynamical component ($\alpha > 0$) uses the **number** of previous events.
- a baseline intensity λ_0 (usually parameterized, $\lambda_0(., \theta)$).
- a Cox-like regression part $e^{Z(t)'\beta}$.

Appl. on recurrent failures of water networks 0000000 Conclusion 00

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~

Generalization to Pena & Hollander model

The Pena-Hollander model

$$\lambda(t) = U\rho(N(t-), \alpha)\lambda_0(\epsilon(t))\psi\left(e^{Z(t)'\beta}\right)$$

- a frailty component : U (non observable source of heterogeneity).
- a dynamical component $\rho(N(t-), \alpha)$
- a baseline intensity λ_0 (usually parameterized, $\lambda_0(., \theta)$).
- a Cox-like regression part $e^{Z(t)'\beta}$.

Remark : LEYP \subset Pena & Hollander

The LEYP process

Appl. on recurrent failures of water networks

Conclusion 00

Some useful properties for dynamic prediction and statistical estimation for the LEYP model.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Conclusion

Conclusion - Bilan

Appl. on recurrent failures of water networks

Conclusion

- many models to handle dynamic intensity of recurrent events.
- the LEYP is one of them, with useful properties
- semiparametric framework has not been investigated (yet)
- recurrent events problems : epidemiology / biostatistics / reliability analysis : bridges exist.
- dynamic versus frailty models : a risk to badly identify dynamic components (in fact due to frailty component) : The negative Binomial distribution is also the marginal for Gamma mixed Poisson processes (Poisson with Gamma frailty)

Appl. on recurrent failures of water networks
